# Global Linen ™

The Global Linen software module enables the commercial laundry service to manage the collections and deliveries of goods to the customer base. We have worked with some of the largest names in the industry to produce a comprehensive product that handles all aspects of linen management.

The software even monitors the number of laundry bags located at each customer's premises and ensures that this level is maintained, resulting in no more bag shortages!

In the example (above) it can be seen that even a multi-floor hotel presents no problems, as a shelf level can be set for each product on each floor, putting the laundry in control of deliveries to each floor. Packing notes and Bag labels contain all required information to enable the delivery driver to place the linen on the correct floor.

If your customer requires a temporary, or a seasonal, increase in stock levels, the pool linen software has facilities to manage these requirements. It even allows the delivery lists to be held 'open' whilst a subsequent delivery is being processed for the same customer. This permits the list to be amended to take account of the actual delivery quantity, rather than using the traditional "to follow" option.

Global Linen also keeps a record of all delivered quantities, allowing a wealth of analytical data to be extracted for managerial purposes. Customer revenue is also stored on a periodic basis, ensuring that every contract can be checked at any time. The screen extract (right) shows the deliveries made for a selected period of time, with the data being held as a weekly total. You can even drill down to the individual lists that make up this total.
