

# Route Management

The Route Manager module enables the Transport Department to easily reschedule each route, and add or remove contracts from it. Where cash is collected, an optional collection sheet is printed for recording the cash amounts collected.

Each route sheet is printed on to standard computer listing paper, or alternatively, on a laser printer, using plain paper. A number of print options are available, ensuring that this standard product can easily adapt to your needs.

In addition to recording the name and delivery address for each drop on the route, the route sheet can be augmented by the addition of 'Types of Supply'. Some of these are shown on the right.

Contracts can then be allocated any number of 'Types of Supply' as required. Contract 1000 is shown on the left, along with a selection from the supply types that relate to it.

A column is reserved on the standard route sheet for types of supply, - some of these are shown (left). When the route sheet is printed, this information, along with other specific product information is printed.

Users of the Multi-Frequency module have the option to include these products on the route sheet as well, and delivery quantities are shown. If a mat is only delivered once in 3 weeks, then Route Manager will automatically include it at the correct time, reducing labour intensive paperwork to practically zero.

Once a contract is added to the database a series of pop up screens enable the chosen day and route data to be displayed. A contract can be inserted at any point in the route, with all other contracts automatically being shuffled down by one drop. The screen on the right shows contract 1000 being inserted as the third drop on the route.

An option has been added to allow a single page per contract to be printed. Where the route information is held in a series of loose leaf binders, it is then easy to, either, add a new sheet or replace an existing sheet with updated data.
