# Web Module

The Web Module will allow your customers to take control of their stock ordering.

Are you having to supply your customers with expensive duplicate books, only for them to lose them or not even bother returning them?

Why not put the onus back on your customer and let them be in charge of ordering what they require when they require it.

The module works on the basis that it allows the customer to log on to their account and place stock orders for the items that they currently use.

The customer not only gets to decide what requirements he needs by delivery day, but he also gets to view past orders, amend current orders and produce advance orders, whilst still allowing you all the controls that you have with your current system.

The screen to the left shows orders that have been processed and are no longer amendable (these are highlighted in RED), but can still be viewed and printed.

Orders that have been placed and are still available to be amended are highlighted in YELLOW.

The screen also shows all possible delivery days that have yet to have an order placed (these are highlighted in GREEN).

The customer will only get to see the products that they are currently contracted to have, and any items required outside of this will need to be added by the laundry, which still provides your with the control.

You are also able to specify what the 'Maximum' level a customer is allowed to order at any given time, as well as being able to give cut off times as to when all orders need to be placed by.

The Module simply allows you to give the customer control of their account ordering, allowing you to monitor and change any orders placed.
